MacOS Tools

Install brew from the instructions given in the link below.

<https://brew.sh/>

After installing homebrew

Create a file in users home directory with name .curlrc with content "-k"
(-k without quotes and give a new line character after -k.)

Steps:

1. Open Terminal
2. echo -k > ~/.curlrc
3. cat ~/.curlrc

Run all the below commands in Terminal

```
brew install --cask virtualbox (Not For MacOS M1/M2)
```

```
brew install --cask vagrant
```

```
brew install --cask vagrant-manager
```

```
brew install git
```

```
brew install --cask homebrew/cask-versions/adoptopenjdk8
```

```
brew install maven
```

```
brew install --cask intellij-idea
```

```
brew install --cask intellij-idea-ce
```

```
brew install --cask sublime-text
```

```
brew install awscli
```
